HW2 Reflection - Takuto Oishi (takutoy)

- Discussion about analysis
    - I found that it is really important to consider the logical structure of an interview from the beginning. I think that if an interview is well structured (with Goal/As-Is/To-Be/Gap) the interview structure and the goal hierarchy will naturally align. However, in my case, I asked some off-topic, or sometimes irrelevant questions, and the overall structure was a bit messy. As a result, I had to connect related but scattered goals and remove duplicates, which was time-consuming.
    - Thinking of the extracted goals as a graph and tracing their dependencies make it easier to identify conflicts that are hard to detect when thinking about each goal individually.
    - Since some conflicts are conditional, we should identify not only which combination is conflicting, but also what conditions and business impact are underlying.
- Discussion about AI
    - AI is useful to extract all possible goals without exception.
    - AI tends to accept goals even if they are tiny. It doesn't have enough domain knowledge to make real-world semantic judgements about their business value and operational impact. For example, AI extracted the following goals, but they were trivial or too detailed for the program manager and could be grouped up.
    - LaundryOrDishwashingDelayedUntilAfterPeak
    - HomePrecooledBeforePeak
    - ThermostatModestlyAdjustedDuringPeak
- Discussion about techniques
    - I think these techniques are useful because we can systematically identify duplicated, missing, or conflicted goals between the stakeholders, which significantly reduces our cognitive load. However, I feel this approach could make it harder to evolve requirements or goals gradually. The first reason is sunk cost bias. I guess people may hesitate to change an existing goal model again when stakeholder goals change. The second reason is that, from my experience, stakeholders sometimes surprisingly easily change their goal and what they say, which makes their goals and needs really unstable. I think we could select a few of the most important goals and focus only on them.
